Getting Started with Vault RIM Essentials

Executive Summary

With traditional Vault RIM implementations, life sciences companies work their way through several stages including workshops, configuration, validation, migration, training, and go-live. However, this journey can pose challenges for smaller teams, including:

- **Time Commitment:** Combined with day-to-day responsibilities, a full implementation project can become overwhelming and result in project delays.

- **System Design and Configuration:** Often, small companies do not have sufficient experience to avoid common pitfalls and mistakes. This "learning curve" can be detrimental and reduce the value of a new system.

- **Validation and User Acceptance Testing:** In traditional implementations, this process alone can take months to accomplish.

- **Data and Document Migration:** In traditional implementations, data migration often doesn't begin until the system is fully configured and live. This extends the effective implementation timeline much longer than initially expected.

Veeva Vault RIM Essentials is specifically designed to bypass these challenges with a three pillar approach:

THREE CORE PILLARS OF THE VAULT ESSENTIALS APPROACH

Pre-Configuration — Pre-Validation — "In-the-System" Training

Vault RIM Essentials comes **pre-configured** to support efficient business processes based on what Veeva has learned from industry leaders and customers. Documentation is provided to help organizations adopt the processes and for use as a reference.

Vault RIM Essentials is **pre-validated** by Veeva and full documentation is provided. Customers may choose to author/execute their own UAT in addition to the validation already performed by Veeva.

Like "on-the-job" training, users are introduced to Vault RIM by performing tasks in their sandbox, validation, and production systems directly. **End-users and administrators get trained in their live system** with the guidance and supervision of the Veeva team.

These three pillars allow customers to implement Vault RIM Essentials in a matter of weeks, compared to traditional system implementations.
